5/17/21: MAGNETIC MORPH

MONOLOGUE WRITTEN BY CLYDE LEWIS

I think that we can all agree that this pandemic has pushed the boundaries of common sense. We have all learned a valuable lesson as we see the masks come off and hopefully a return to normal and that is the vested interests of health bureaucrats and Big Pharma and Deep Government prevails over common sense and real science.

Oscar Wilde one said:

Those who guide the mobs can only do so by following the mobs.

There is a paranormal effect which has been called the 100th monkey effect. Where learned behavior spreads instantaneously from one group of monkeys to all related monkeys once a critical number is reached. The paranormal aspects of the effect is that even unrelated species of monkeys can find themselves doing the same actions as the others – even when those monkey’s can’t relate or even know the other monkeys. It is a paranormal and sometime debunked method of discussing and predicting change. Not just any kind of change but

change that influences movement of consciousness.

Change so often happens quickly and unexpectedly and the adaptation to that change is a remarkable thing to watch on a social level. Not all things remain the same and some things reach a tipping point or a point of autonomy.

Autonomy can be broadly understood as simply rejecting any large, centralized and hierarchical structures tied to the nation-state.

Autonomy should also be understood as a way to be independent from corporate influence or multinational control mechanisms that wish to contribute or support change. Change with autonomy is self-starting and should be done without well-known political structures that have been proven time and again as being corrupt and divisive. Change created in a revolutionary way is change without an enabling by political opportunism or corporate support. It is change that is sought independently and it is change that is sought for a benefit of separation and freedom.

Behaviors and ideas are viral.

For the past week, I have been receiving videos and e-mails telling me that people they know who have received the vaccine have been able to take a magnet and put it over the injection site and miraculously it will stick. The magnet adheres to the skin and when they pull it away the skin pulls up and then it snaps back into place. Well, of course, I needed to investigate this.

Coincidentally as I was watching some of the videos online, my wife called on her lunch break to tell me that her and her coworkers were discussing this and that she had shared with her co-workers that she had an epiphany about how the COVID-19 virus was a technology and

that the vaccine itself is an interesting technology that is not the same as regular vaccines.

She said to me over the phone – I hope you address this because everyone is talking about it.

I said I would – only if she would let me put a magnet on her injection site.

She laughed and said – no.

Last night as I was getting ready for bed, I wanted to do a search on Google as to whether or not there was a report from a mainstream news source about this phenomenon. As you have probably guessed, every fact checker, every search, led me to stories that say that none of this is true – that there is a logical explanation as to why magnets are sticking to people's arms.

According to Snopes, Full Fact, USA Today, Yahoo news and fact check this is all a big internet hoax. Each site claimed that people who are doing this are convinced that there are microchips in their vaccines. Well of course these sites will tell you that it is a hoax because they are certainly hoping that you will not be discouraged from getting your vaccine. Any “dissident” voice you have ever heard of through corporate media is always fake or a hoax. The system does not hand out free publicity to its actual enemies.

TikTok recently took down a number of viral videos that allegedly demonstrated this magnetic attraction, and Instagram blurred a similar video, labeling it false information. According to the Full Fact website “The vaccines do not contain a microchip and there is nothing in a vaccine that could cause a magnet to stick to your skin after getting it.” Now an average person would do a search on Google to find out if any of these magnetic morpchs are true news and would most certainly see that the top entries are telling you that a good story has gotten in the way of truth.

The mainstream media and the controllers of online information push the systems for the system by the system. Those who are on TV telling us what to think use their journalism skills at the minimum and their smirking words for the power elite at the maximum.

We know that many behind the vaccine agenda are not altruistic. I don't know what is worse watching people record themselves putting magnets on their arms or the incentivizing of people to get vaccinated. When I see a large number of people go online with their phone cameras and record themselves putting magnets on their arms, you have to stop and wonder who was the first person to discover this?

Why are people taking their refrigerator magnets and putting them on their arms?

Why do they stick? – it is laughable if not intriguing because if it is a big hoax then we are seeing a new kind of mass hysteria and people are actually believing that magnets are sticking to their arms. Some people have gone as far as shaking their arms in hopes the magnet will drop off – but it doesn't. Usually, these people have high intensity magnets which stick to just about anything. I think this whole magnet morphosis is probably like the time people all over the south were making snowballs and trying to melt them with a lighter. The rare cold of our dark winter had people not used to the show wondering if it was synthetic or fake snow. I even joked that now you don't have to have a covid card or a Passport—all you need is a magnet and place it on the arm and you get to go anywhere without a mask... magnet sales would sky rocket. But as I have said many times, there is always a kernel of truth in what the mainstream will call, misinformation. According to several abstracts from the National Library of Medicine and the National Center for Biotechnology information Superparamagnetic nanoparticle delivery has been used effectively in many vaccines especially DNA vaccines.

According to their website:

The efficiency of delivery of DNA vaccines is often relatively low compared to protein vaccines. The use of superparamagnetic iron oxide nanoparticles (SPIONs) to deliver genes via magnetofection shows promise in improving the efficiency of gene delivery both in vitro and in vivo. In particular, the duration for gene transfection especially for in vitro application can be significantly reduced by magnetofection compared to the time required to achieve

high gene transfection with standard protocols.

Superparamagnetic iron oxide nanoparticles or SPIONs are the most extensively used functional nanomaterials as antibacterial agents, and for other biomedical applications due to their unique physical, chemical, magnetic and biocompatibility properties. They are magnetic nanoplatforms that are used as drug carriers.

Guiding magnetic iron oxide nanoparticles with the help of an external magnetic field to its target is the principle behind the development of superparamagnetic iron oxide nanoparticles as novel drug delivery vehicles. SPIONs are small synthetic maghemite or magnetite particles with a core ranging between 10 nm and 100 nm in diameter. These magnetic particles are coated with certain biocompatible polymers, such as dextran or polyethylene glycol, which provide chemical handles for the conjugation of therapeutic agents and also improve their blood distribution profile.

If the mainstream media did their homework, they would report that SPIONs have been used before in certain Malaria vaccines.

SPIONs are also used in optogenetics as well.

Optogenetics, enables researchers to switch populations of related neurons on or off on a millisecond-by-millisecond timescale with pulses of laser light. Another recently developed method, called chemogenetics, uses engineered proteins that are activated by designer drugs and can be targeted to specific cell types.

Understanding how the brain generates behavior is one of the ultimate

goals of neuroscience – and one of its most difficult questions. In recent years, researchers have developed a number of methods that enable them to remotely control specified groups of neurons and to probe the workings of neuronal circuits.

Electronics are getting imperceptibly small, opening new avenues for medical technology to place advanced monitoring and treatment devices inside our bodies.

Recently Columbia University engineers demonstrated a new and revolutionary version of this, creating the world's smallest single-chip system ever developed, according to a recent study published in the journal *Science Advances*.

And, critically, the tiny new chip can be implanted via a hypodermic needle to measure internal body temperature, and potentially much more.

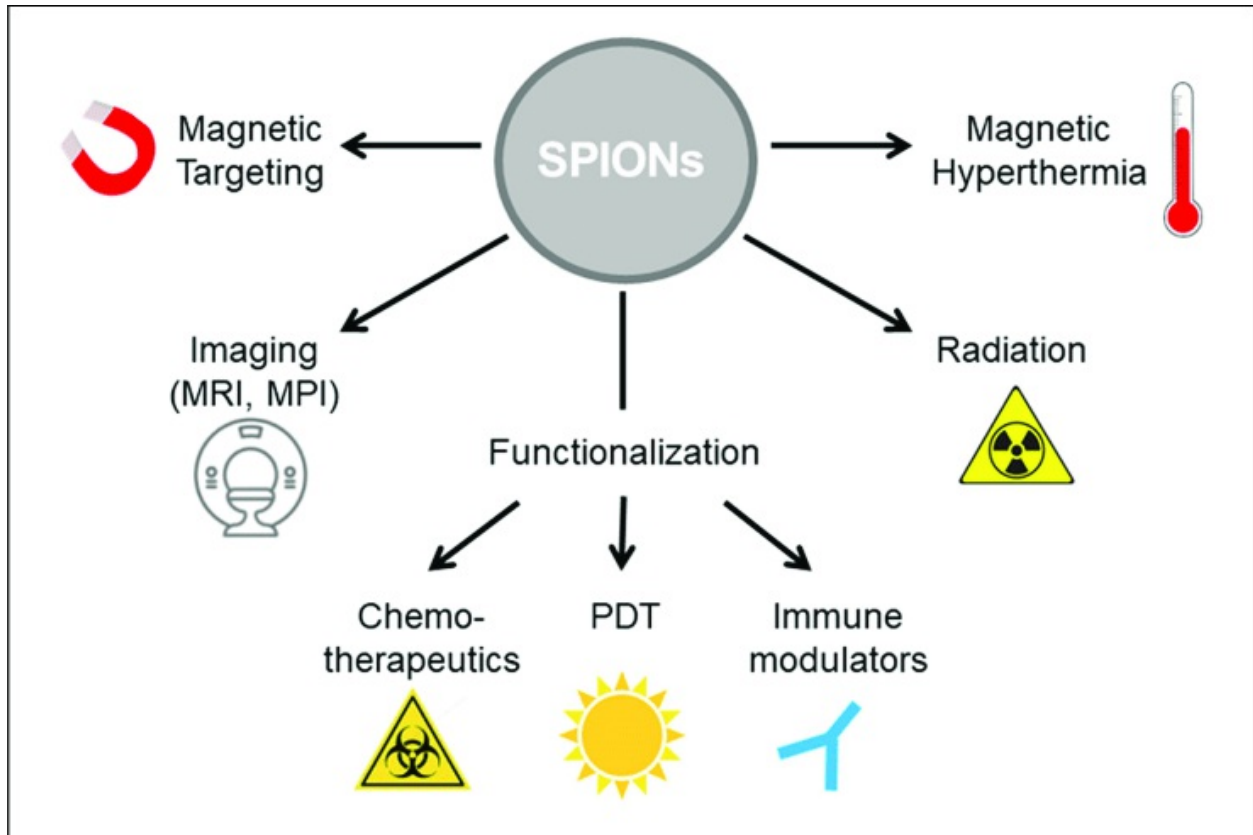

The implant created by the engineers at Columbia is record-breakingly small, but it's also breaking new ground in simply existing as a wholly functional, electronic circuit whose total volume is less than 0.1 cubic millimeter. In other words, it's the size of a dust mite, not to mention far more compact than the world's smallest computer, which is a cube-shaped device precisely 0.01-inches (0.3 mm) on each side. The smaller, new chip is only visible with a microscope, and pushed the envelope in power-sourcing and communications ingenuity design.

Typically, small electronics feature radio frequency (RF) modules capable of transmitting and receiving electromagnetic signals, this method generates wavelengths too large to originate from devices as

small as the new one. Alternatively, ultrasound wavelengths are far smaller at specific frequencies because the speed of sound is a lot slower than the speed of light at which all electromagnetic waves move. Consequently, the Columbia team of engineers integrated a piezoelectric transducer capable of functioning like an “antenna” for wireless communication and powering using ultrasound waves.

When incorporated with a low-power temperature sensor to transform the chip into a real-time temperature probe, the device possesses the ability to monitor body temperature in addition to small variations in temperature linked to the therapeutic use of ultrasound. In the study, the implant’s proof-of-concept was carried out on live mice, in which it employed ultrasound neurostimulation. This involved implanting up to seven mice at once with intramuscular injection via syringe.

Scientists are saying that this injectable microchip may be useful in monitoring respiratory function, glucose levels, and blood pressure.

Ken Shepard, leader of the Columbia study, in a report from New Atlas, stated that these small SPION chips should be revolutionary for developing wireless, miniaturized implantable medical devices that can sense different things, be used in clinical applications, and eventually approved for human use,” added Shepard. In a post-coronavirus world, it’s not difficult to see the immediate benefits of mass injections of benign devices capable of monitoring your temperature. One day, something like this could be an early warning system to officials of a brewing pandemic. And while the tiny computer chip is still in its earliest stages, there’s much more to expect as medical technology begins to push into tomorrow’s cybernetics.

So, before you start calling people crazy for putting refrigerator

magnets on their arms, there again is precedent for the possibility that these SPIONS are being used in the vaccines.

We have reported in the past that both the Moderna and Pfizer vaccines both contain mRNA wrapped in lipid nanoparticles that help carry it to human cells but also act as an adjuvant, a vaccine ingredient that bolsters the immune response. The nanoparticles chemically attach themselves to Polyethylene glycol molecules that cover the outside of the particles and increase their stability and life span.

The science is available to anyone who wishes to report the truth about the Vaccines. University of Virginia in Charlottesville, has described in an advance online publication in the journal Nature Neuroscience that SPIONS and Chemomagnetics using Magneto proteins are used in order to deliver noninvasive ways to monitor the human body.

Several earlier studies have shown that nerve cell proteins which are activated by heat and mechanical pressure can be genetically engineered so that they become sensitive to radio waves and magnetic fields, by attaching them to an iron-storing protein called ferritin, or to inorganic paramagnetic particles. These methods represent an important advance – they have, for example, already been used to regulate blood glucose levels in mice – but involve multiple components which have to be introduced separately.

The new technique builds on this earlier work, and is based on a protein called TRPV4, which is sensitive to both temperature and stretching forces. These stimuli open its central pore, allowing

electrical current to flow through the cell membrane; this evokes nervous impulses that travel into the spinal cord and then up to the brain.

Does anyone remember what was said by chief medical officer Tal Zaks of Moderna with regard to how the vaccines are being used as operating systems in the human body?

These messenger RNA platforms are an “operating system” designed to program human beings and turn their cells into efficient drug delivery systems.

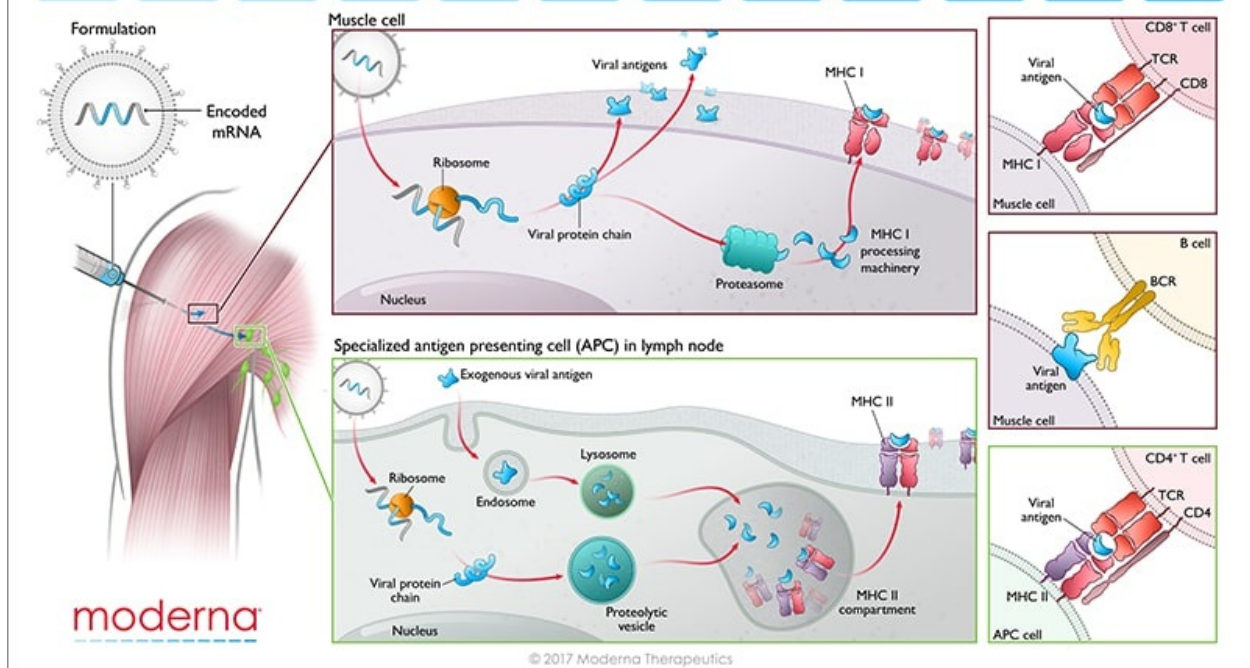

Once injected into humans, this program is carried out in the individual’s body, at the cellular level.

The mRNA platform is where, Big Pharma merges with Big Tech, enslaving human beings to a controlling system designed to profit from their cellular and biological functions into the unforeseeable future.

Continued on next page

Moderna's mRNA Vaccine Approach

Closely mimics a native viral infection leading to B and T cell responses

As mRNA platforms go live on human populations, Moderna admits that healthy human immune responses can actually destroy the mRNA sequences before they get into the person's cells. The immune system may attack the program and its RNA fragments, leading to negative outcomes that could include molecular deficiencies, and possibly hormonal defects.

If the protein folding is disrupted, the proteins may never achieve their desired functionality, leading to partial development of antigens that never confer targeted immunity to coronavirus spike proteins.

The body may turn on its own cells in the process, causing hyper-inflammatory responses and autoimmune issues that are the precursor to organ failure and various disease processes. My sister has acute renal failure after she received her first shot — she was rushed to the hospital and was cared for and now she has

recovered. However it was a close call that had us all worried. The people behind the mRNA experimentation of humans are building psychological justification and scientific precedent to declare human immune systems incapable.

In this way, people will submit their bodies to the latest mRNA programs as they become dependent on the biological software that have been created for them. This is an open door toward trans-humanism, and millions of people are buying into it. By casting shame on human immune systems, drug companies have also found the perfect alibi for when their experiments cause injury in humans.

The drug companies claim that It's not the injected technology that is causing allergic reactions, seizures, infertility and death, It's the individual's human's immune system that is causing all the pain and misery, they demand.

It is plausible deniability at its most diabolical.

The drug companies will demand that more carefully crafted mRNA programs and interventions will be needed to "perfect" human beings. Moderna brags that, "several hundred scientists and engineers are solely focused on advancing Moderna's platform technology." These scientists are attempting to "hack" humans with bio-information and, make populations dependent on the technology...

Moderna has even dubbed their mRNA platform the 'Software of Life.' These scientists are looking for ways to help the foreign mRNA avoid immune detection. They are also experimenting with ways to trick the cell's ribosomes into processing the mRNA as if it was natural. They are also plotting ways to instruct the human cells to produce the

artificial proteins long term. Moderna was founded on the success of using modified RNA to reprogram the function of a human stem cell, therefore genetically modifying it.

As these RNA “operating systems” are installed in human bodies, it becomes even more clear that drug companies are looking to genetically modify and own human proteins while controlling biological processes for generations to come.

On both a psychological and physiological level, human beings are being branded like cattle as they submit to these mRNA software programs.

This system is complete cellular manipulation, using foreign biological molecules to code, decode, regulate, change the expression of, and alter the physiological instructions within human beings.

This system is not medicine, nor is it vaccination it is an advanced technology.
